1. Why form households?
2. The household structure:
evolution and facts

1. Why form households?

Why do humans live in families? The fact that only 3 percent of avian and mammal species are known to be familial (Emlen 1995) suggests that the emergence of the family cannot be taken for granted, even among humans. Something special must be behind it.

Most households are formed between two particular people for reasons of love, companionship, and procreation. On the other hand, biological motives matter when males and females only care about their genetic fitness, that is, the survival and propagation of their own genes.

“Household
Approach: Facts

Prof. José
Alberto Molina

The fact that Gary Becker received the 1992 Nobel Prize in Economics for his contributions to the economics of the household is sufficient evidence that its importance is recognized by the economics profession.

Becker put the household on the economics profession agenda, in 1976, by identifying the three foundational assumptions of the economic approach to the household as “maximizing behaviour, market equilibrium, and stable preferences” (*The Economic Approach to Human Behavior*, University Chicago Press).

“Household
Approach: Facts

Prof. José
Alberto Molina

The focus of Becker, as well as of subsequent studies, has been to provide a new reason for forming households: the efficiency gains from trade that a man and a woman can realize by marrying, compared to remaining single, taking into account that marriage is broadly defined to include both formal unions and cohabitation.

The gains to marriage arise from gender specialization in home and market activities.

In other words, gains arise from replacing individual constraints with less restrictive joint constraints, applying to households formed between any two persons.

“Household
Approach: Facts

Prof. José
Alberto Molina

There may be joint consumption economies, because many items of household expenditure have characteristics of a public good; that is, consumption per head does not decline proportionately with the number of consumers. The most obvious of these is a house, but also appliances, furniture, etc.

We can also focus on the allocative efficiency gains from the formation of a two-person household arising from the division of labour and household production between household members.

“Household
Approach: Facts

Prof. José
Alberto Molina

Given that the household is one of the most important socio-economic institutions in our society, the nature of the links between family members varies dramatically across nationalities.

Do countries with a culture fostering strong family ties tend to have different economic outcomes than more individualistic societies?

While sociologists and political scientists have paid attention to this question, this is an issue generally ignored by economists.

This is why we then provide some empirical evidence on the evolution and facts of households at an international level

“Household
Approach: Facts

Prof. José
Alberto Molina

- The evolution of household structure is important to make policy in areas such as childcare, education, housing, and elderly care.

- Europe:

Decreasing average household size (from 2.4 in 2008 to 2.3 in 2018)

Increasing one person households (from 30% in 2008 to 34% in 2018)

- Spain in 2018:

Average size of all households: 2.5

Distribution: Couple (around 50%) and Single (29%)

Number of children: 1 (50%), 2 (40%), 3/more (10%)

Increasing mean age at first marriage: females (33) and males(35)

Falling crude marriage rate and increasing crude divorce rate

Increasing separated/divorced proportion of parents

**High relevance of household models,
but without forgetting the unitary models**
