# The Radon-Nikodým property

Let X be a Banach space,  $C \subset X$  be convex and closed. Let  $\mathbb{H}$  be the set of all the open half-spaces of a Banach space X.

#### Definition

*C* has the **Radon-Nikodým property** if for every bounded subset *A* of *C* and every  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $A \cap H \neq \emptyset$  and  $\operatorname{diam}(A \cap H) < \varepsilon$ .

Let M be a metric space.

#### Definition

A map  $f: C \to M$  is said to be **dentable** if for every nonempty bounded set  $A \subset C$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $A \cap H \neq \emptyset$  and  $\operatorname{diam}(f(A \cap H)) < \varepsilon$ .

Let M be a metric space.

#### Definition

A map  $f: C \to M$  is said to be **dentable** if for every nonempty bounded set  $A \subset C$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $A \cap H \neq \emptyset$  and  $\operatorname{diam}(f(A \cap H)) < \varepsilon$ .

• C has the RNP if and only if the identity  $\mathbb{I}: C \to C$  is dentable.

ELE SQC

Let M be a metric space.

#### Definition

A map  $f: C \to M$  is said to be **dentable** if for every nonempty bounded set  $A \subset C$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $A \cap H \neq \emptyset$  and  $\operatorname{diam}(f(A \cap H)) < \varepsilon$ .

- C has the RNP if and only if the identity  $\mathbb{I}: C \to C$  is dentable.
- The RNP was extended to linear operators by Reĭnov (1975) and Linde (1976). In 1977 Reĭnov characterised RN-operators as those bounded operators *T* : *X* → *Y* satisfying that for every nonempty bounded set *A* ⊂ *X* and every ε > 0 there exists *x* ∈ *A* such that *x* ∉ conv(*A* \ *T*<sup>-1</sup>(*B*<sub>Y</sub>(*T*(*x*), ε)).

## Outline

2 Properties of dentable maps

-

## Dentable maps and dentable sets

Let  $C \subset X$  be a closed convex set. Then the following are equivalent:

- (i) the set C has the RNP;
- (ii) for every metric space (M, d), every continuous map  $f: C \to M$  is dentable;
- (iii) every Lipschitz function  $f: C \to \mathbb{R}$  is dentable.

The proof is based on a result by García-Castaño, Oncina, Orihuela and Troyanski (2004).

## The space of dentable maps

We denote by

 $\mathcal{D}_U(C, M)$  the set of dentable maps from C to M which are uniformly continuous on bounded subsets of C.

If *M* is a vector space, then  $\mathcal{D}_U(C, M)$  is a vector space. Assume moreover that *C* is bounded. Then:

- (a) if M is a complete metric space, then  $\mathcal{D}_U(C, M)$  is complete for the metric of uniform convergence on C;
- (b) if M is a Banach space, then  $\mathcal{D}_U(C, M)$  is a Banach space;
- (c) if M is a Banach algebra (resp. lattice), then  $\mathcal{D}_U(C, M)$  is a Banach algebra (resp. lattice).

A = A = A = A = A = A = A

## The space of dentable maps

Given a bounded subset A of C,  $x^* \in X^*$  and t > 0, we denote

$$S(A, x^*, t) = \{x \in A : x^*(x) > \sup\{x^*, A\} - t\},\$$

## The space of dentable maps

Given a bounded subset A of C,  $x^* \in X^*$  and t > 0, we denote

$$S(A, x^*, t) = \{x \in A : x^*(x) > \sup\{x^*, A\} - t\},\$$

#### Definition

We say that  $x^*$  is *f*-strongly slicing on  $A \subset C$  if  $\lim_{t\to 0^+} \operatorname{diam}(f(S(A, x^*, t))) = 0.$ 

Let  $f \in \mathcal{D}_U(C, M)$  and  $A \subset C$  be a bounded subset. The set of *f*-strongly slicing functionals on *A* is a  $\mathcal{G}_{\delta}$  dense in  $X^*$ .

Given C bounded,  $f_1, \ldots, f_n \in \mathcal{D}_U(C, M)$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $C \cap H \neq \emptyset$  and max $\{ \operatorname{diam}(f_1(C \cap H)), \ldots, \operatorname{diam}(f_n(C \cap H)) \} < \varepsilon$ .

ELE SOC

Given C bounded,  $f_1, \ldots, f_n \in \mathcal{D}_U(C, M)$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $C \cap H \neq \emptyset$  and max $\{ \operatorname{diam}(f_1(C \cap H)), \ldots, \operatorname{diam}(f_n(C \cap H)) \} < \varepsilon$ .

The following corollary was observed by Bourgain.

Given C bounded and  $x_1^*, \ldots, x_n^* \in X^*$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $C \cap H \neq \emptyset$  and  $\max\{\operatorname{diam}(x_1^*(C \cap H)), \ldots, \operatorname{diam}(x_n^*(C \cap H))\} < \varepsilon$ .

< ロ > < 同 > < 三 > < 三 > < 三 > < 三 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Given C bounded,  $f_1, \ldots, f_n \in \mathcal{D}_U(C, M)$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $C \cap H \neq \emptyset$  and max $\{ \operatorname{diam}(f_1(C \cap H)), \ldots, \operatorname{diam}(f_n(C \cap H)) \} < \varepsilon$ .

The following corollary was observed by Bourgain.

Given C bounded and  $x_1^*, \ldots, x_n^* \in X^*$  and  $\varepsilon > 0$ , there is  $H \in \mathbb{H}$  such that  $C \cap H \neq \emptyset$  and  $\max\{\operatorname{diam}(x_1^*(C \cap H)), \ldots, \operatorname{diam}(x_n^*(C \cap H))\} < \varepsilon$ .

Assume that  $f_1, \ldots, f_n \in \mathcal{D}_U(C, M)$  and  $f : C \to M$  is a continuous map such that  $f(x) \in \{f_1(x), \ldots, f_n(x)\}$  for every  $x \in C$ . Then  $f \in \mathcal{D}_U(C, M)$ .

Assume that  $f: C \to \mathbb{R}$  is uniformly continuous on bounded sets. Then f is dentable if and only if |f| is dentable.

The above result fails when the modulus is replaced by the norm for dentable maps.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

We have also considered the dentability of the identity map  $I: (C, \|\cdot\|) \to (C, d)$  where d is a metric which is uniformly continuous with respect to the norm.

Let C be a closed convex subset which is dentable with respect to a complete metric d defined on it. Assume moreover that d is uniformly continuous on bounded sets with respect to the norm and induces the norm topology. Then C has the RNP.

## Outline

Properties of dentable maps

E SQA

# $\mathcal{DC}$ functions

### Definition

A function  $f: C \to \mathbb{R}$  is said to be  $\mathcal{DC}$  (or **delta-convex**) if it can be represented as the difference of two convex continuous functions on C, and it is said to be  $\mathcal{DC}$ -Lipschitz if it is the difference of two convex Lipschitz functions.

# $\mathcal{DC}$ functions

### Definition

A function  $f: C \to \mathbb{R}$  is said to be  $\mathcal{DC}$  (or **delta-convex**) if it can be represented as the difference of two convex continuous functions on C, and it is said to be  $\mathcal{DC}$ -Lipschitz if it is the difference of two convex Lipschitz functions.

### Theorem (Cepedello, 1998)

A Banach space X is superreflexive if, and only if, every Lipschitz function  $f: X \to \mathbb{R}$  can be approximated uniformly on bounded sets by  $\mathcal{DC}$  functions which are Lipschitz on bounded sets.

# $\mathcal{DC}$ functions

### Definition

## Finitely dentable functions

Given a dentable map  $f: C \to M$  defined on a bounded set we may consider the following "derivation"

$$\begin{split} &[D]'_{\varepsilon} = \{ x \in D : \operatorname{diam}(f(D \cap H)) > \varepsilon, \ \forall H \in \mathbb{H}, x \in H \} \\ &[C]^{\alpha+1}_{\varepsilon} = [[C]^{\alpha}_{\varepsilon}]'_{\varepsilon} \\ &[C]^{\alpha}_{\varepsilon} = \bigcap_{\beta < \alpha} [C]^{\beta}_{\varepsilon} \text{ if } \alpha \text{ is a limit ordinal }. \end{split}$$

EL SQA

## Finitely dentable functions

Given a dentable map  $f: C \to M$  defined on a bounded set we may consider the following "derivation"

$$\begin{split} [D]'_{\varepsilon} &= \{ x \in D : \operatorname{diam}(f(D \cap H)) > \varepsilon, \ \forall H \in \mathbb{H}, x \in H \} \\ [C]^{\alpha+1}_{\varepsilon} &= [[C]^{\alpha}_{\varepsilon}]'_{\varepsilon} \\ [C]^{\alpha}_{\varepsilon} &= \bigcap_{\beta < \alpha} [C]^{\beta}_{\varepsilon} \text{ if } \alpha \text{ is a limit ordinal }. \end{split}$$

Definition

We say that

*f* is **finitely dentable** if for every  $\varepsilon > 0$  there is  $n \in \mathbb{N}$  such that  $[C]_{\varepsilon}^{n} = \emptyset$ . *f* is **countably dentable** if for every  $\varepsilon > 0$  there is  $\alpha < \omega_{1}$  s.t.  $[C]_{\varepsilon}^{n} = \emptyset$ .

# Dentability and $\mathcal{DC}$ -functions

A set *D* is said to be a  $(\mathcal{C} \setminus \mathcal{C})_{\sigma}$ -set if  $D = \bigcup_{n=1}^{\infty} (A_n \setminus B_n)$ , where  $A_n$  and  $B_n$  are convex closed sets. A function  $f : \mathcal{C} \to \mathbb{R}$  is said to be  $(\mathcal{C} \setminus \mathcal{C})_{\sigma}$ -measurable if the sets  $f^{-1}(-\infty, r)$  and  $f^{-1}(r, +\infty)$  are both  $(\mathcal{C} \setminus \mathcal{C})_{\sigma}$  subsets of *X* for each  $r \in \mathbb{R}$ .

Let  $f: C \to \mathbb{R}$  be a uniformly continuous function defined on a bounded closed convex set. Consider the following statements:

- (i) f is uniform limit of  $\mathcal{DC}$  functions;
- (ii) f is uniform limit of  $\mathcal{DC}$ -Lipschitz functions;
- (iii) f is finitely dentable;
- (iv) f is countably dentable;
- (v) f is  $(\mathcal{C} \setminus \mathcal{C})_{\sigma}$ -measurable;
- (vi) f is pointwise limit of  $\mathcal{DC}$ -Lipschitz functions.

Then  $(i) \Leftrightarrow (ii) \Leftrightarrow (iii) \Rightarrow (iv) \Rightarrow (v) \Rightarrow (vi) \Rightarrow (v) \Rightarrow (iv) \Rightarrow (iii).$

# Relation with $\mathcal{DC}$ maps

#### Definition (Veselý-Zajíček, 1989)

A continuous map  $F: C \to Y$  is said to be a  $\mathcal{DC}$  map if there exists a continuous (necessarily convex) function  $f: C \to \mathbb{R}$ , called **control** function for F, such that  $f + y^* \circ F$  is a convex continuous function on A for every  $y^* \in S_{Y^*}$ 

## Relation with $\mathcal{DC}$ maps

#### Definition (Veselý-Zajíček, 1989)

A continuous map  $F: C \to Y$  is said to be a  $\mathcal{DC}$  map if there exists a continuous (necessarily convex) function  $f: C \to \mathbb{R}$ , called **control** function for F, such that  $f + y^* \circ F$  is a convex continuous function on A for every  $y^* \in S_{Y^*}$ 

Let us notice that f is a control function for F if, and only if,

$$\left\|\sum_{i=1}^{n} \lambda_{i} F(x_{i}) - F(\sum_{i=1}^{n} \lambda_{i} x_{i})\right\| \leq \sum_{i=1}^{n} \lambda_{i} f(x_{i}) - f(\sum_{i=1}^{n} \lambda_{i} x_{i})$$
  
whenever  $x_{1}, \dots, x_{n} \in A$ ,  $\lambda_{1}, \dots, \lambda_{n} \geq 0$  and  $\sum_{i=1}^{n} \lambda_{i} = 1$ .

# Relation with $\mathcal{DC}$ maps

### Definition (Veselý-Zajíček, 1989)

A continuous map  $F: C \to Y$  is said to be a  $\mathcal{DC}$  map if there exists a continuous (necessarily convex) function  $f: C \to \mathbb{R}$ , called **control** function for F, such that  $f + y^* \circ F$  is a convex continuous function on A for every  $y^* \in S_{Y^*}$ 

Let us notice that f is a control function for F if, and only if,

$$\left\|\sum_{i=1}^n \lambda_i F(x_i) - F(\sum_{i=1}^n \lambda_i x_i)\right\| \leq \sum_{i=1}^n \lambda_i f(x_i) - f(\sum_{i=1}^n \lambda_i x_i)$$

whenever  $x_1, \ldots, x_n \in A$ ,  $\lambda_1, \ldots, \lambda_n \ge 0$  and  $\sum_{i=1}^n \lambda_i = 1$ .

Let  $D \subset Y$  be a closed convex set. Then the following are equivalent: (i) the set D has the RNP;

(ii) for every Banach space X and every convex subset  $C \subset X$ , every bounded continuous  $\mathcal{DC}$  map  $F \colon C \to D$  admitting a bounded control function is dentable.
